METHOD FOR REMEDIATING POLYFLUOROCARBON-CONTAMINATED SOIL

RELATED APPLICATION

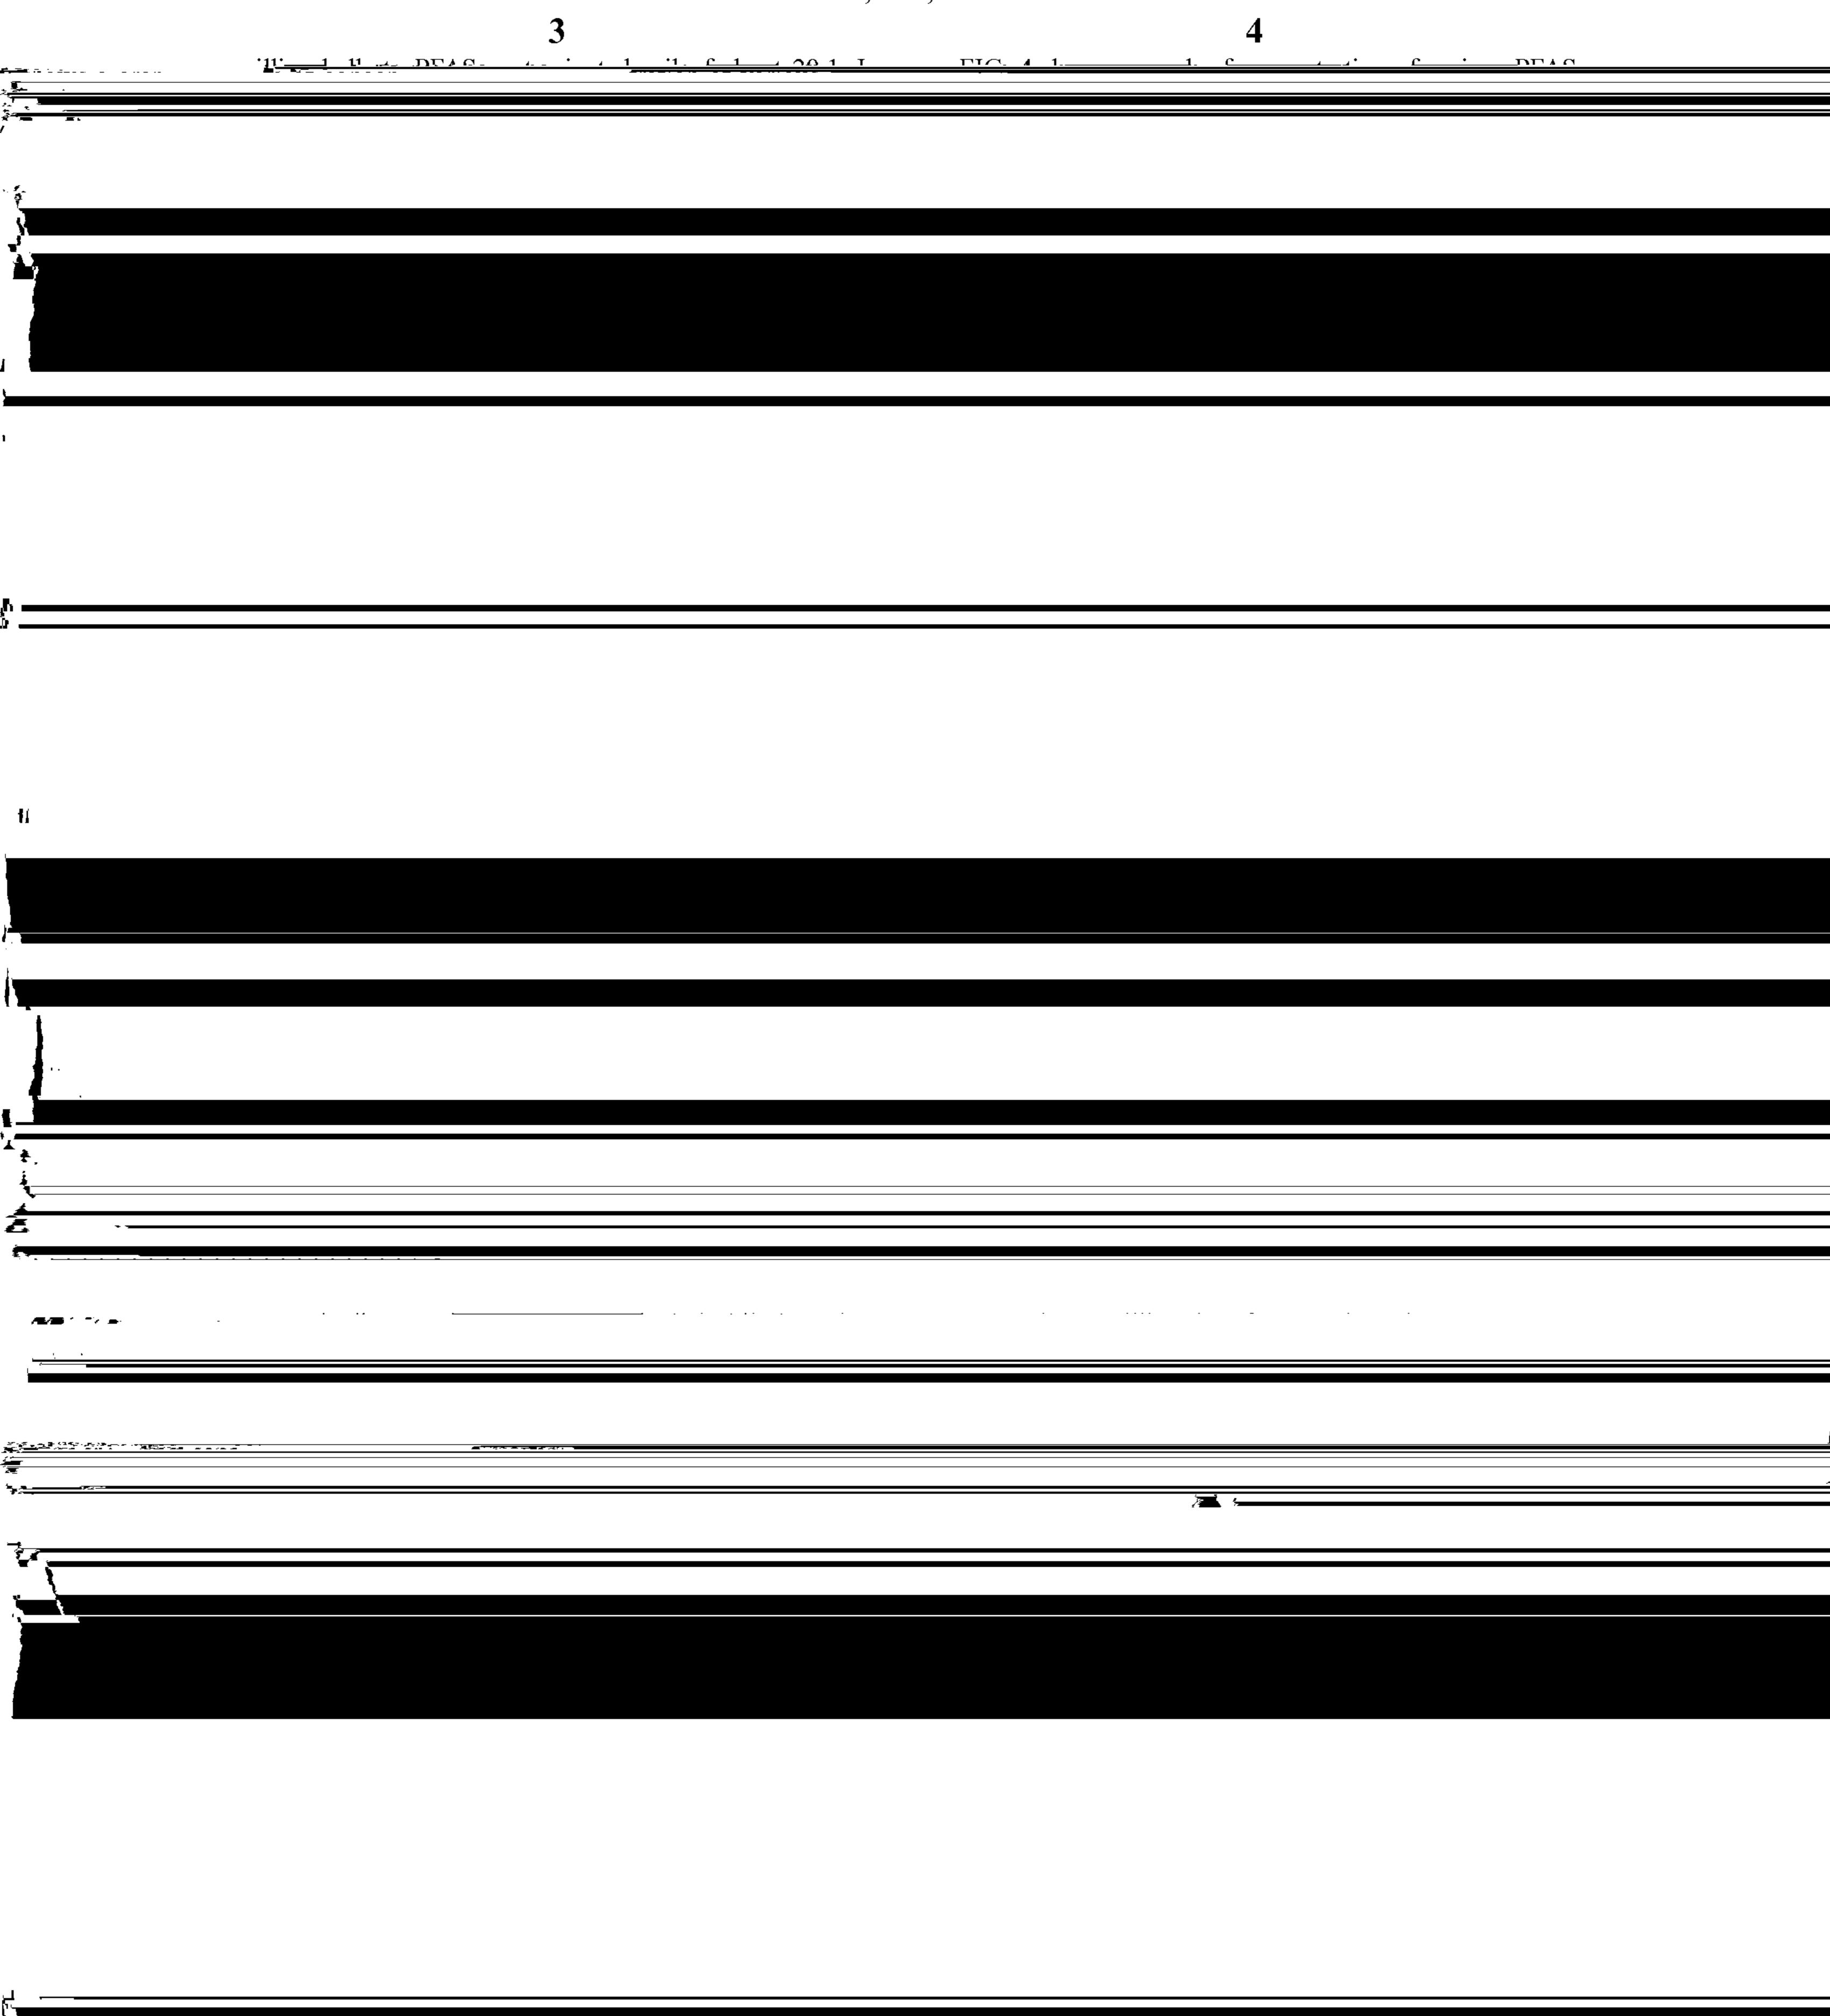

This application claims the benefit of the filing date of

2

the liver and kidneys. Since these compounds are lipophobic, they do not enter fatty-tissues the way many other organic contaminants may.

PEAS impacted soil is a continuous source of contamination to groundwater, which threatens supplies of drinking water as well as ecosystems. Unfortunately, options for treating or remediating PFAS-contaminated sites are limited.

2019, the contents of which are incorporated herein by able for PFAS-contaminated soil include encapsulation,

6

	that the level of PFAS contamination in the soil is less than	per sulphate, phosphorus pentoxide, potassium hydroxide,

(PFUnA), fluorotelomer and fluorotelomer sulfonate (FTS). PFOS destruction percentages and fluoride recovery 11. The method of claim 1, wherein the PFAS-contami-

crete, asphalt, or granular activated carbon materials.

24. A method for remediating per- and polyfluoroalkyl 5 substances (PFAS)-contaminated soil, comprising: disposing PFAS-contaminated soil into a ball mill; disposing a plurality of milling balls in the ball mill; and operating the ball mill until a specified PFAS contamination target level is achieved, wherein the remediation is 10 conducted in the absence of a hydroxide base.
